OLUDOLAPO MOYOSORE ADEGBESAN

omadegbesan27@my.fisk.edu | +1 (509) 919-5430 | linkedin.com/in/oludolapo-adegbesan | Github: Havcker243

EDUCATION

Fisk University **Expected Graduation: Dec 2026**
Bachelor of Science in Computer Science **GPA:** 3.62
Relevant Coursework: Windows Application Development | Data Structures and Algorithms | Internet Application Development | Networks | Database Management | Digital Logic Design | Discrete Math | Computer Architecture

TECHNICAL SKILLS

Languages: C/C++, Python, TypeScript, JavaScript, C#, HTML5/CSS, SQL
Frameworks: React.js, Next.js, Node.js, MySQL, Flask.py, Langchain, .NET
Developer Tools: GitHub, Git, Docker, AWS, Firebase, Supabase, Render, Vercel

WORK EXPERIENCE

Google
Incoming Software Engineer Intern May 2026

Google
Software Developer Intern May 2025 - Aug 2025

- Built a Chrome extension using **TypeScript** and **Gemini LLM** to analyze and summarize privacy policies in real time, improving user comprehension while maintaining on-device privacy constraints.
- Designed and implemented a testing pipeline (**30+** test cases across **30+** real-world policies) to evaluate and optimize **LLM prompt performance**, reducing **hallucination** and improving response reliability in production.

Propel2Excel
Software Developer June 2024 - September 2024

- Developed backend **API** functionality for job board integration using **JavaScript**, **SQL**, and **Python**, enabling access to **200+** positions and driving a **20%** increase in student applications.
- Designed and implemented a **MySQL** database schema to store job API data, improving data management efficiency and frontend accessibility by **10%.**

Ashoka
Software Engineer Intern May 2024 - August 2024

- Developed an AI-powered summary tool using **LangChain** and **Python** to compile information from **20+** fellows' websites and LinkedIn profiles and provided details, reducing information retrieval time by **20%**.
- Engineered **RESTful API** endpoints and user interface components for data verification, enabling internal users to approve or reject information from fellows' sources, resulting in a **10%** increase in data verification efficiency.

PROJECTS

Aplite | Founder | *Next.js, FastAPI, Supabase, PostgreSQL, Vercel, Render*

- Built a payment identity platform to replace insecure bank-detail sharing in B2B payouts across vendor workflows
- Designed a full-stack onboarding and business verification system (KYB) with role-based access and multi-step flows
- Implemented encrypted payout storage and APIs for secure resolution of payment details without exposing raw data

FiskGrad | *Next.js, FastAPI, Supabase, PostgreSQL, OpenRouter, Vercel, Render*

- Built an **AI-powered** degree planning platform generating personalized academic roadmaps across **14+** majors using transcript parsing and **LLM-based** recommendation.
- Engineered a **FastAPI** backend with **JWT** authentication, role-based access, and **PDF** parsing pipelines, enforcing secure, institution-restricted access with rate limiting
- Deployed a **cloud-based** system on **Vercel** and **Render**, enabling real-time course planning, degree audit exports, and automated calendar generation for streamlined user workflows

RAF | *Python, FastAPI, React, TypeScript, Vite, Tailwind CSS, D3.js, OpenRouter, Vercel, Railway*

- Built a recursive **multi-agent AI** framework in **Python** that decomposes complex tasks, routes work across GPT, **Claude**, **Gemini**, and **OpenRouter models**, and manages long-horizon execution.
- Designed a proposal, voting, and validation pipeline with spec checking, repair loops, fallback handling, and caching to improve output quality and **reliability**.
- Developed the orchestration **backend** and web-based trace UI for real-time execution monitoring, model routing, recursive planning, and dependency-aware task execution.

Studyme | Flask, OpenAI, MongoDB, AWS, Redis

- Developing a Flask-based AI-powered document assistant that processes PDFs, DOCX, and PPTX files, generating AI-driven summaries, explanations, and optional flashcards using OpenAI's GPT models.
- Implementing a web search API integration, enabling users to access relevant online resources based on AI-extracted key points.
- Building a scalable backend with plans to integrate MongoDB for storage, Redis for caching, and AWS for deployment, ensuring efficient performance and minimal API redundancy.

Text Frequency Analyzer | *C/C++, Goggle test*

- Built a Text Frequency Analyzer to swiftly compute and analyze word occurrences in large texts, employing optimized algorithms and robust data structures to improve efficiency and precision
- Enhanced the Word Frequency Analyzer by integrating sentiment analysis and diverse export options (CSV, JSON, TXT), enabling positive or negative assessments and flexible data sharing
